

SmartCheck

MEASURE YOUR  
CYBER RISK

 Huntsman®

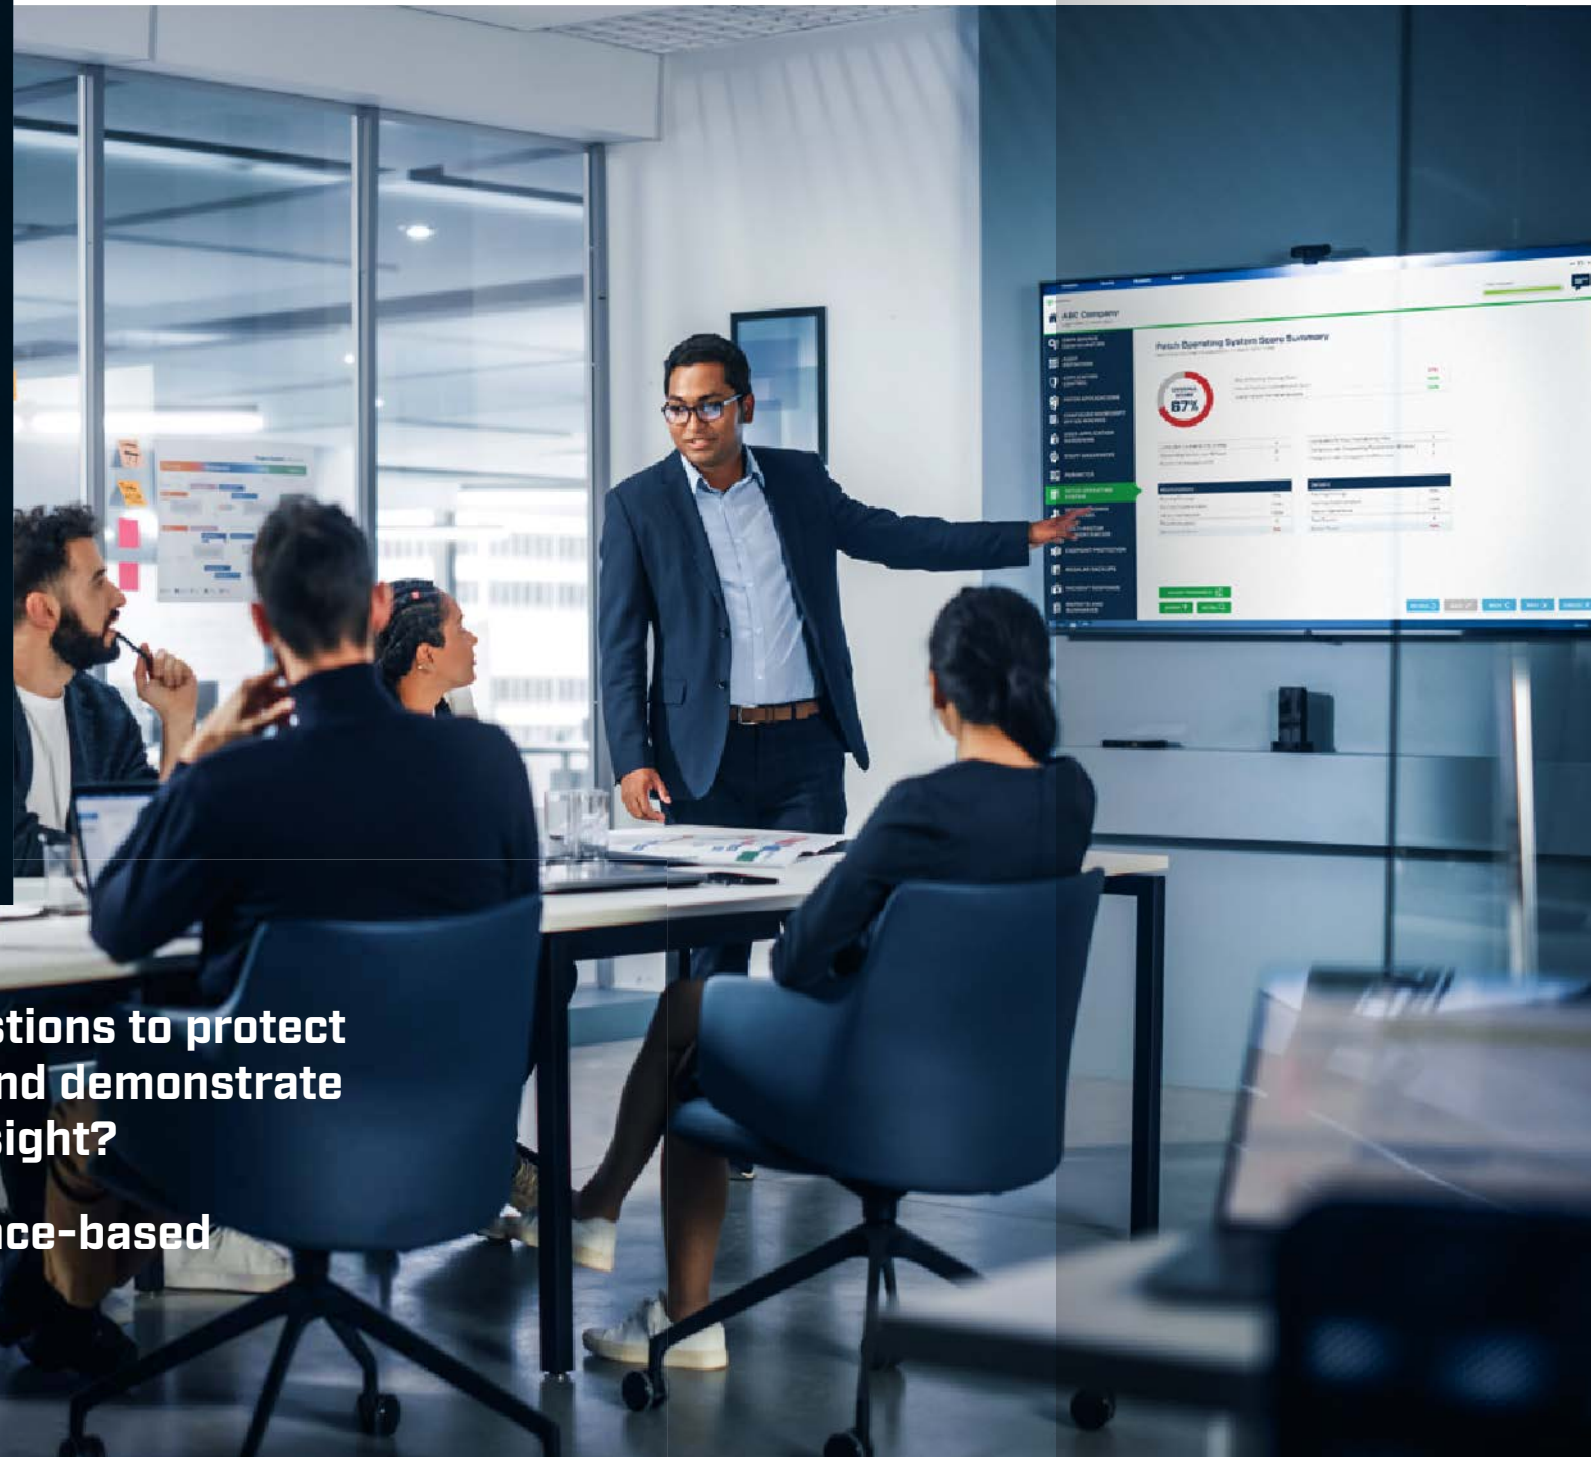

# CYBER RISK REPORTING

with systematic,  
data-driven  
measurement

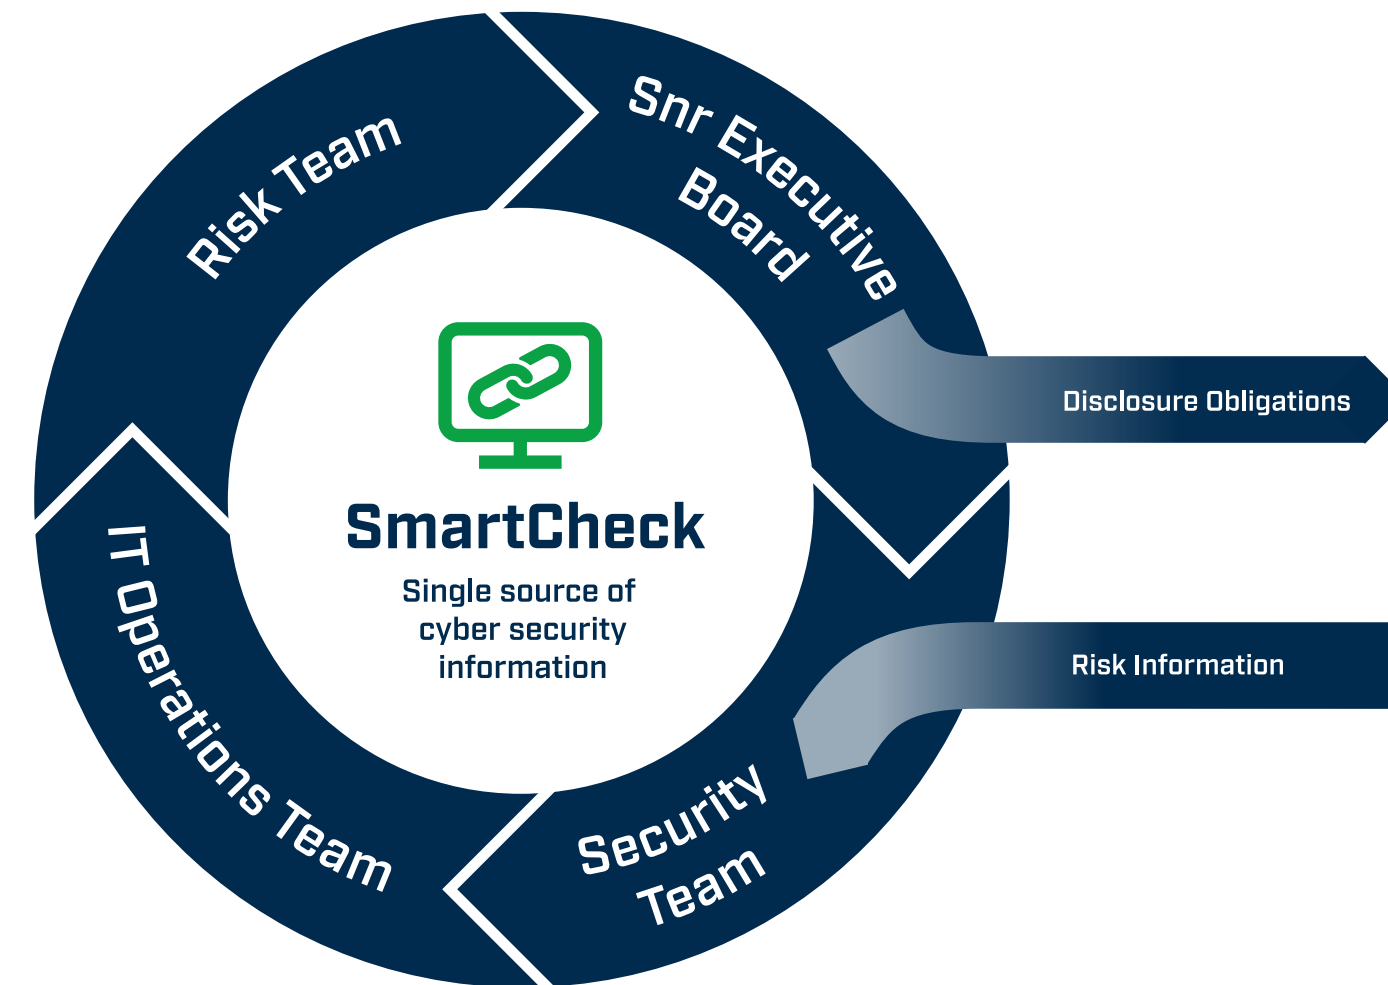

Are you asking the right questions to protect your organisation's assets, and demonstrate that you have informed oversight?

Do you have access to evidence-based information?

## Data-driven Cyber Security Measurement

A Single Source of Truth for Risk Management Stakeholders

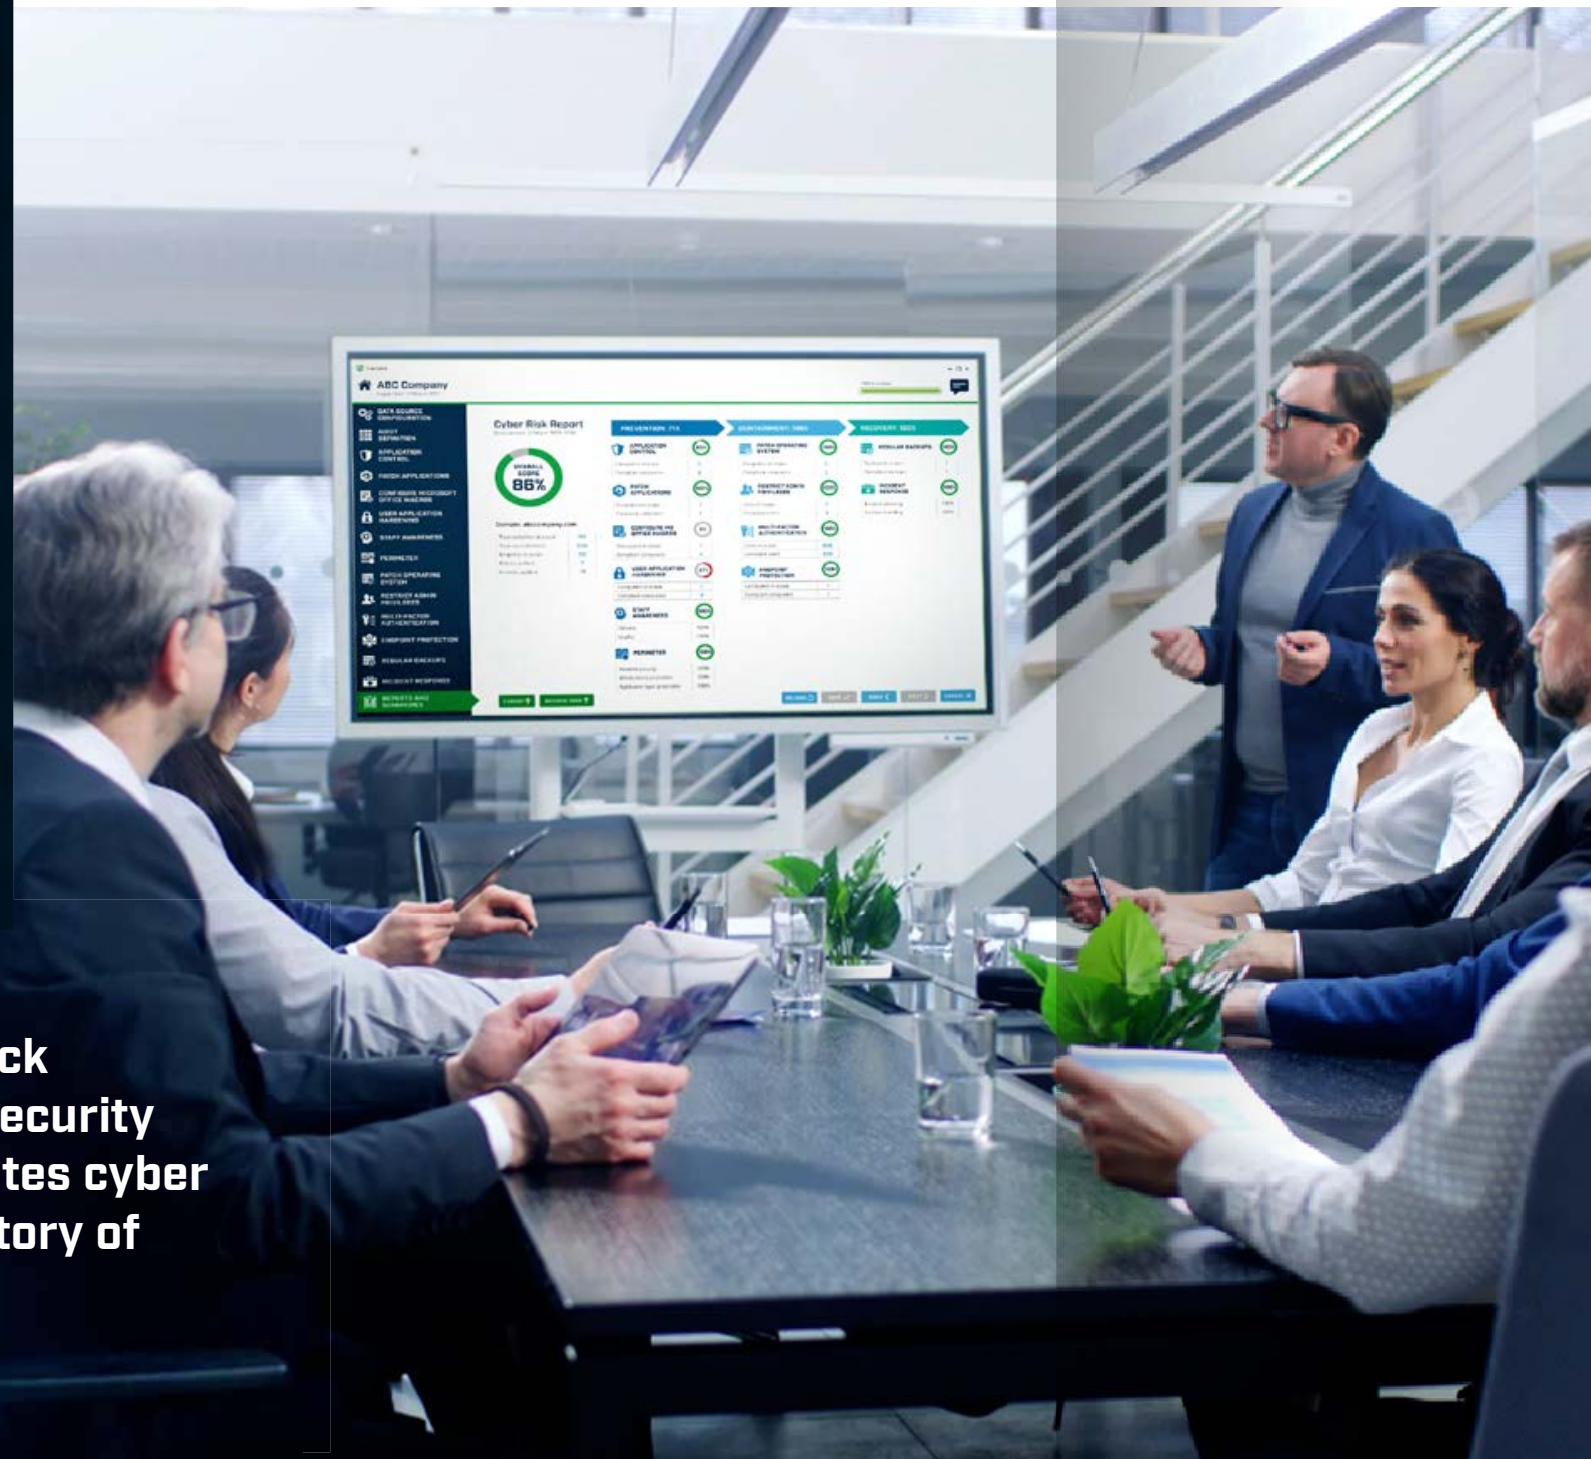

One application to fulfil your cyber-risk management obligations and boost operational resilience for you and 3rd parties

# THE SINGLE SOURCE OF TRUTH for cyber reporting

Designed to assess your attack surface and measure cyber security posture, SmartCheck automates cyber reporting into a single repository of risk information.

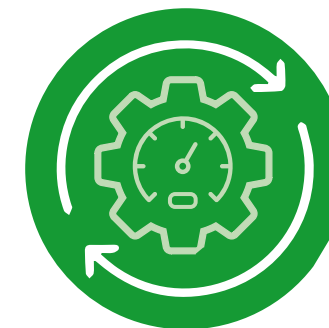

## SmartCheck automates your cyber-risk reporting with systematic, data-driven measurement.

By measuring 12 summary security control categories aligned to NCSC and NIST guidance, the SmartCheck application equips you to reduce your risk of a cyber-attack, and improve your cyber resilience across the organisation.

Designed to assess your attack surface and measure cyber security posture, SmartCheck

automates cyber reporting into a single repository of risk information - streamlining GRC reports for Management, Risk Teams, and Directors. It provides operational reports to enable security and engineering teams to identify and remediate cyber issues.

Has your organisation shifted to automated risk measurement, or are you still relying on a manual approach?

Does your team regularly identify your cyber deficits and then apply fixes?

If your executive asked for a measure of your Cyber Security Posture, are evidence-based metrics available?

# STRENGTHEN YOUR CYBER RESILIENCE and recovery capabilities

By building your operational resilience with SmartCheck, you can work to manage the risk of disruption from a cyber incident.

## Business continuity

SmartCheck informs you of the risk of a cyber attack impacting your business activities.

With automated data-driven reporting, SmartCheck equips security teams with a tactical dashboard to quickly visualise key cyber security issues needing resolution – supporting ongoing, continuous prevention and mitigation activities.

### SmartCheck helps organisations to minimise:

- The time required to identify any changes in your attack surface and any emerging vulnerabilities before they become a risk.
- The cost of disruption and down-time by identifying risks early, and prompting their remediation.

Because it measures the performance of your key detection, containment and recovery controls SmartCheck provides clear and accurate direction to improve your operational resilience in the face of a cyber attack and minimise:

- The risk of overall revenue losses of a business interruption.
- The potential impact and cost of reestablishment of systems or productivity.

## Risk management and governance

Generate weekly automated cyber posture reports for your management, risk team, operations team and board.

SmartCheck's Management and Director level reports ensure leaders have the right level of visibility of cyber-risks to stay informed of your organisation's cyber security posture – supporting good governance practices.

### SmartCheck provides:

- Systematic and quantifiable reports to all risk management stakeholders, with proof of performance - including 56 individual measurements within 12 summary categories.
- Visibility and accurate measurement of the effectiveness of each security risk control.

It is a single application to satisfy your GRC and operational cyber-risk management requirements.

**SmartCheck increases your cyber governance, risk and compliance capacity with evidence-based security information for Management, Risk Teams, and the Board.**

## Insurance and 3rd party requirements

Produce verifiable cyber posture reports to manage premiums and satisfy stakeholders.

As external cyber reporting and verification requirements now extend beyond government directives, SmartCheck supports you with evidence-based reporting to confirm your security controls.

Used separately, the cyber posture of 3rd party suppliers can also be measured to aid your cyber insurance renewals.

As 3rd parties, in their pursuit of greater risk control-effectiveness, request proof of your status to minimise their own operational risks,

SmartCheck equips your team with automated data-driven information to easily produce reliable quantitative cyber-risk reports within minutes.

### SmartCheck automates reporting for:

- Insurers who base your eligibility for cybercover on the verification of your security control effectiveness.
- 3rd party suppliers and partners increasingly requiring positive proof that the changing cyber-risk status of other parties in the supply chain doesn't introduce unmitigated risk into their operations.

SmartCheck delivers a new standard in supporting contractual and cyber insurance information requirements, within a single easy-to use application.

## Asset & data protection

Guard your organisation's reputation with increased risk visibility & immediate reporting of emerging cyber issues

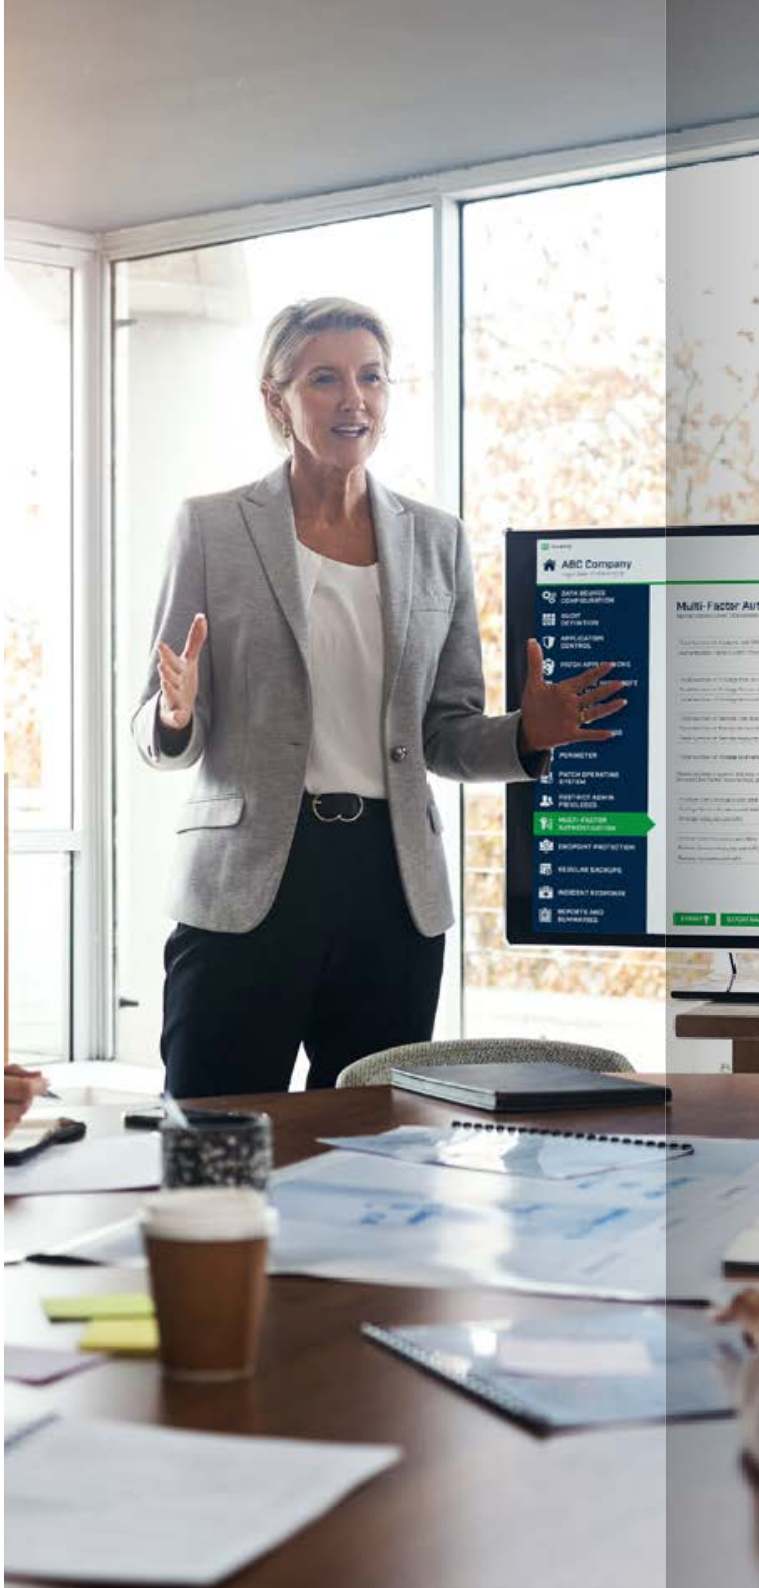

SmartCheck gives you immediate and clear visibility of your IT assets and systems and the security controls that protect your organisation and its operation.

Cyber attacks can quickly escalate into an uncontrollable situation. Confirmation that critical assets or sensitive data has been accessed is everyone's worst fear. Operational disruption, loss of customer data and falling shareholder value can have massive reputational and financial implications for everyone concerned.

It is vital for all of those responsible for the oversight of cyber security risk management to have clear visibility of the cyber security risks the organisation is facing, and an understanding of the business implications of those residual risks.

Visibility of your key security controls and an understanding of your business risk implications are essential elements in managing organisational cyber-risks such as ransomware or any other malware attacks.

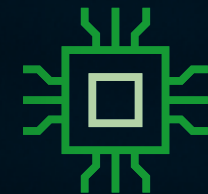

SmartCheck equips all the members of your cyber-risk management team with a shared set of security information to identify the gaps and apply fixes to minimise the risk of data loss and ensuing reputational damage.

## COMPETITIVE ADVANTAGE

**ON-DEMAND RANSOMWARE  
READINESS RATING**

**RELIABLE EVIDENCE BASED  
ASSESSMENT**

**AUTOMATED REPORTING  
AGAINST STAFF &  
SYSTEM READINESS**

**SmartCheck automatically measures the effectiveness of your security controls. It identifies any gaps and a “to-do list” of ransomware mitigation requirements.**

## Solutions

Leverage our industry specific cyber security techniques and tactics to improve the fidelity of your cyber risk management controls.

### DEFENCE

Cyber security in Defence & Intelligence is at the forefront of cyber security risk, under constant attack, and operating in inherently risky or hostile environments. Our in-depth experience and understanding of these highly sensitive environments, and the data contained within, make Huntsman Security a preferred option across the UK and Australia.

### CRITICAL INFRASTRUCTURE

Huntsman Security is experienced in supporting critical infrastructure organisations to manage their cyber security risk controls, with applications supporting security control monitoring and measurement. Our comprehensive attack surface capabilities automatically verify your IT assets, measure vulnerabilities and report any areas of changing cyber-risk.

### FINANCE

In the financial sector, security and risk are closely linked. Preventing data breaches and the associated fallout of financial loss and reputational damage is critical to your organisation's success. Our software helps you ensure that the cyber-risk controls that support the protection of your customers' personally identifiable information, meet your government and industry regulatory requirements, and support auditing by your security teams and external auditors.
